

Golden Crust Bakery — CSS Improvements

1. I Fixed Broken Code the Browser Was Ignoring

When I wrote my original CSS, I made some small typing mistakes that caused the browser to silently ignore those rules. For example, I used commas instead of dots in font sizes (1,35rem instead of 1.35rem), and I spelled colour-related properties the British way (background-colour instead of background-color), which CSS does not recognise. I also referenced colour variables like --charcoal and --white in my styles without ever defining them. Once I fixed all of these errors, the browser was able to read and apply my styles correctly.

2. I Made My Navigation Links Visible

I noticed that the links in my header were almost impossible to read because I had set them to a dark brown colour on top of a dark charcoal background. To fix this, I changed the link colour to a light cream/white so they stand out clearly against the dark header. I also added a gold highlight effect that appears when the user hovers over a link, which makes the navigation feel more interactive and professional.

3. I Redesigned My Product Page Layout

My original product page displayed all the bread items in one long vertical list, with very large 500x500 pixel images that made users scroll endlessly. I replaced this with a CSS Grid layout that displays three product cards side by side on a desktop screen. Each card has a consistent image height, a hover lift effect, and the price is styled in bold gold text. This makes the page look much more like a real online shop.

4. I Made My Website Responsive for Mobile Devices

My original CSS had no media queries at all, which meant the website looked broken on phones and tablets. I added breakpoints so that the layout automatically adjusts depending on the screen size. On smaller screens the header stacks vertically, the product grid reduces to two columns and then one column, and the padding shrinks to keep the content readable. This ensures anyone visiting the site from a phone gets a good experience.

5. I Matched My Footer CSS to My Actual HTML

In my original stylesheet I had written footer styles expecting a logo, contact details, and a button to be present. However, my actual HTML footer only contains a simple copyright line. This mismatch caused the footer to render incorrectly. I rewrote the footer

CSS to match what I actually have in my HTML — a clean, centred dark bar with a gold top border that matches the header style.

6. I Fixed the Button Hover Effect

My button hover effect was supposed to make the button lift upward slightly when a user hovers over it. However, I had accidentally written `translateY` as `translate(-1px)`, which moved the button sideways to the left instead of upward. I corrected this to `translateY(-2px)` so the button now lifts up as intended, giving it a more polished and responsive feel.

7. I Styled the Contact Page Sections

On my contact page I have several section headings such as “TALK TO US” and “DELIVERY AREAS”. Before my CSS upgrade these were displaying as plain default browser text with no visual separation. I styled them as warm beige strips with a gold left border, which makes each section easy to identify and gives the page a more organised, professional appearance.

Summary of All Improvements

Overall, my CSS upgrade addressed both technical bugs and visual design problems. Here is a complete list of everything I improved:

- Fixed missing CSS variable definitions (`–charcoal`, `–white`, `–shadow`)
- Corrected font-size typos that used commas instead of decimal points
- Fixed British spelling in transition properties
- Changed nav link colour to white so they are readable on the dark header
- Added a gold glow hover effect to navigation links
- Replaced the single-column product list with a responsive CSS Grid
- Added media queries for phone and tablet screen sizes
- Styled contact page section headings with a gold left border accent
- Added rounded corners and shadow styling to the Google Maps embed
- Corrected the button hover to lift upward instead of moving sideways
- Rewrote the footer CSS to match my actual HTML content
